Client Communication

COATES MASTER

New Built | Private Residential Bathroom

A bespoke residential interior balancing warm materiality, architectural detailing and technical precision to create a calm everyday retreat.

Role
INTERIOR ARCHITECT

Status
Completed

Sector
Residential

Software
AutoCAD | Virtual Worlds

DESIGN DEVELOPMENT

Initial design studies explored:

- Balanced Spatial Symmetry
- Direct Circulation
- Strong Visual Axis
- Natural Daylight
- Integrated Storage

DESIGN INTENT

BUILT REALITY

TECHNICAL COORDINATION & PLANNING

Skylight

Maximising Natural Light

THE TREVOR PODS

Study | Modular Therapy Space

A modular therapy environment exploring how enclosure, scale and materiality can improve privacy, emotional comfort and therapeutic interaction.

Healthcare

Software
AutoCAD | Sketch up

SPATIAL STRATEGY

The pods are distributed along a linear site condition, forming a sequence of semi-private therapeutic rooms.

The layout avoids traditional corridor typologies, instead creating:- Visual buffering between sessions- Soft circulation transitions- Non-hierarchical spatial relationships

USER EXPERIENCE

Each Pod is a Private 1:1 Therapy Room

Designed for:

- 1 therapist
- 1 client
- Seated face-to-face dialogue

The circular enclosure creates a protected environment that minimises external distraction while maintaining a comfortable face-to-face therapeutic setting.

FORM & SYSTEM

The seating and enclosure are generated through repetitive vertical ribs:

- CNC-fabricated timber elements
- Modular assembly logic
- Scalable diameters (2-4m)

The geometry operates simultaneously as structure, furniture and spatial boundary.

MATERIAL STRATEGY

Cork wall lining provides:

- Acoustic absorption
- Warm tactile quality
- Psychological softness

Natural materials and indirect lighting replace clinical aesthetics with a grounded and comforting atmosphere.

The project demonstrates how
spatial enclosure, materiality
and modular construction can
actively support psychological
wellbeing.

SPA EN SUITE

New Built | Luxury Residencial Bathroom

A luxury en-suite designed as a private wellness retreat, combining natural materials, warm lighting and integrated spa technology to create a calm residence experience.

Role
INTERIOR ARCHITECT

Status
Completed

Sector
Luxury Residencial

Software
AutoCAD | Virtual Worlds

SPATIAL STRATEGY

The layout was organized around four design principles:

- Clear wet & dry zoning
- Strong visual axis towards the vanity
- Open circulation with frameless glazing
- Reflected light to enhance perceived space

WELLNESS INTEGRATION

Steam Enclosure
Sunshower Integration
Freestanding Wellness Bath
Ambient LED Lighting

JOINERY & COORDINATION

Custom joinery and concealed service coordination allowed all functional elements to integrate within a clean architectural composition.

1. Integrated Mirror Cabinet
2. Japanese WC
3. Bespoke Vanity
4. Detail LED Lighting

WELLNESS SYSTEM INTEGRATION

Wellness technologies were integrated within the architectural envelope through coordinated lighting, drainage, ventilation and bespoke detailing.

1. Corner Niche
2. Sunshower and Steamroom
3. Wet room Sytem
4. Floatation bath

A restrained material palette was selected to create a calm, spa-inspired residential environment.

MATERIALITY

- Warm Taj Mahal Stone
- Dark Walnut Joinery
- Brushed Red Gold Accents
- Soft Indirect Lighting
- Clear Frameless Glazing

THE COCOON

Concept Study | Neurodiverse Residential Space

A London flat designed for a client experiencing high-functioning depression. This project explores how interior architecture can act as a behavioural framework — supporting focus, stability and controlled social interaction through spatial form, light and material continuity.

SPATIAL STRATEGY

Clear adjacency between office, kitchen and living areas supports routine — essential for clients managing fluctuating motivation levels.

A continuous timber surface mediates between private and social zones.

Curves define the workspace, reducing distraction and creating psychological containment.

As the geometry straightens, the space becomes more open and socially structured.

MODEL TESTING

The process of designing the wall

FOAM 1/25

The first test was in foam which allowed for transparency and play with light, this was broad back up later in the process.

MDF 1/20

Next step was test it in MDF. This gave a better idea of the layering and structure, first tested with circular columns, to then go to cross section steel ones.

PLYWOOD 1/2

The final model was to experiment with the structure of the layers themselves and how the final product would look like.

MATERIAL & ENVIRONMENTAL RESPONSE

MAMJ Portfolio

The project positions interior architecture not as aesthetic styling, but as an environmental support system.
